Harmonised protocol AIM 2020.

Dr. M.A. Miranda. University Balearic Islands (Spain)

Aedes invasive mosquito species in Europe

Aedes aegypti

Aedes japonicus

Aedes albopictus

Aedes koreicus

Aedes atropalpus

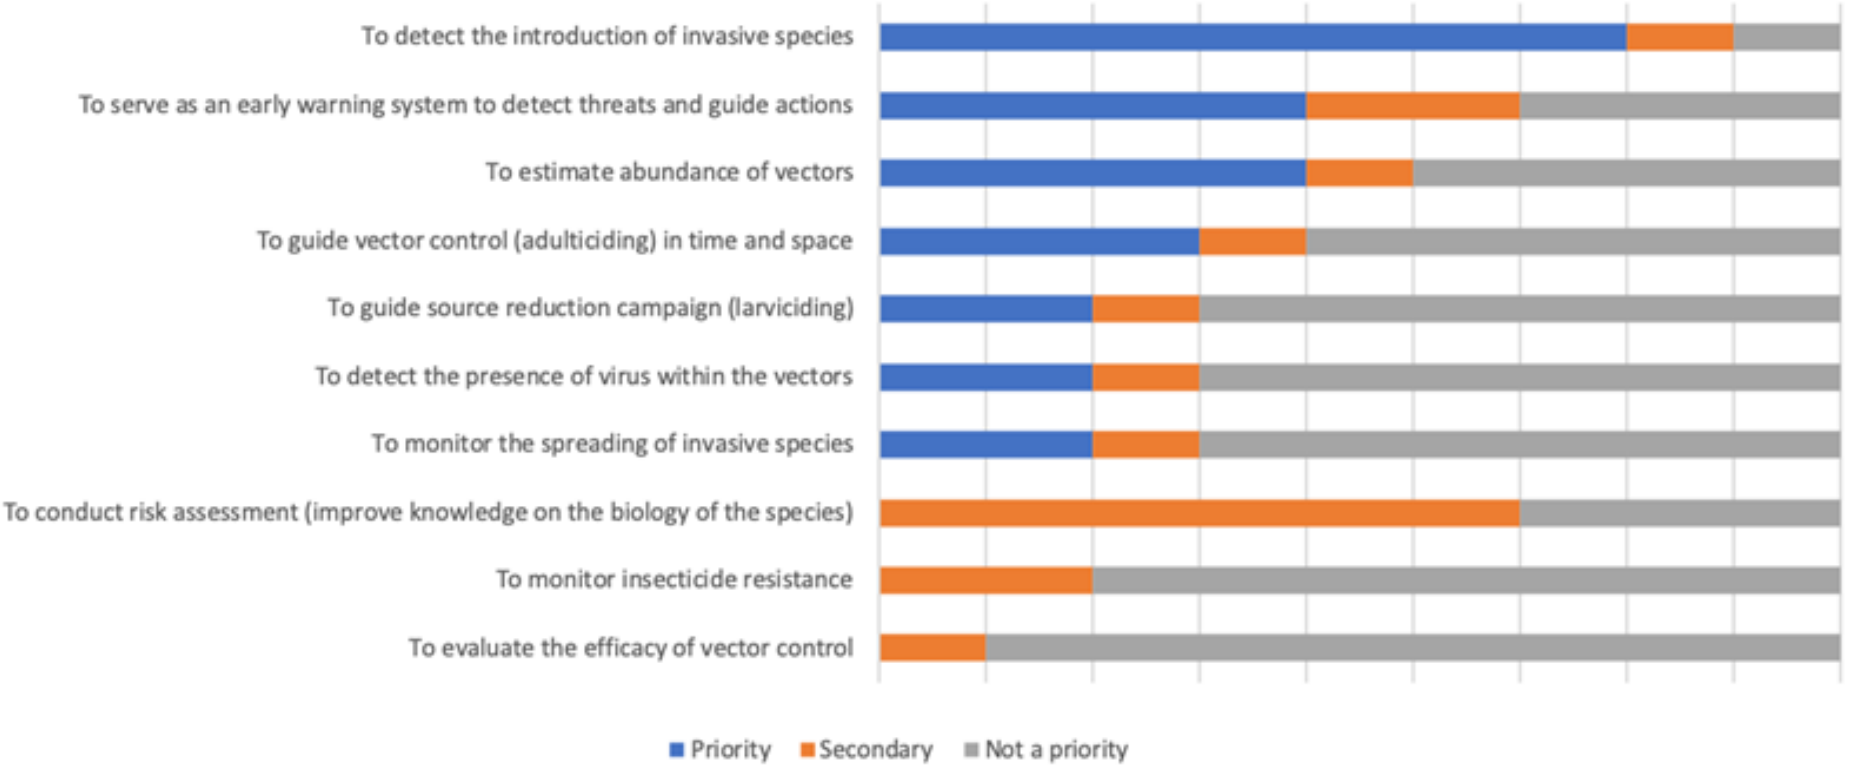

Aedes triseriatus (eradicated)

WG1 MONITORING & SURVEILLANCE of AIMs.

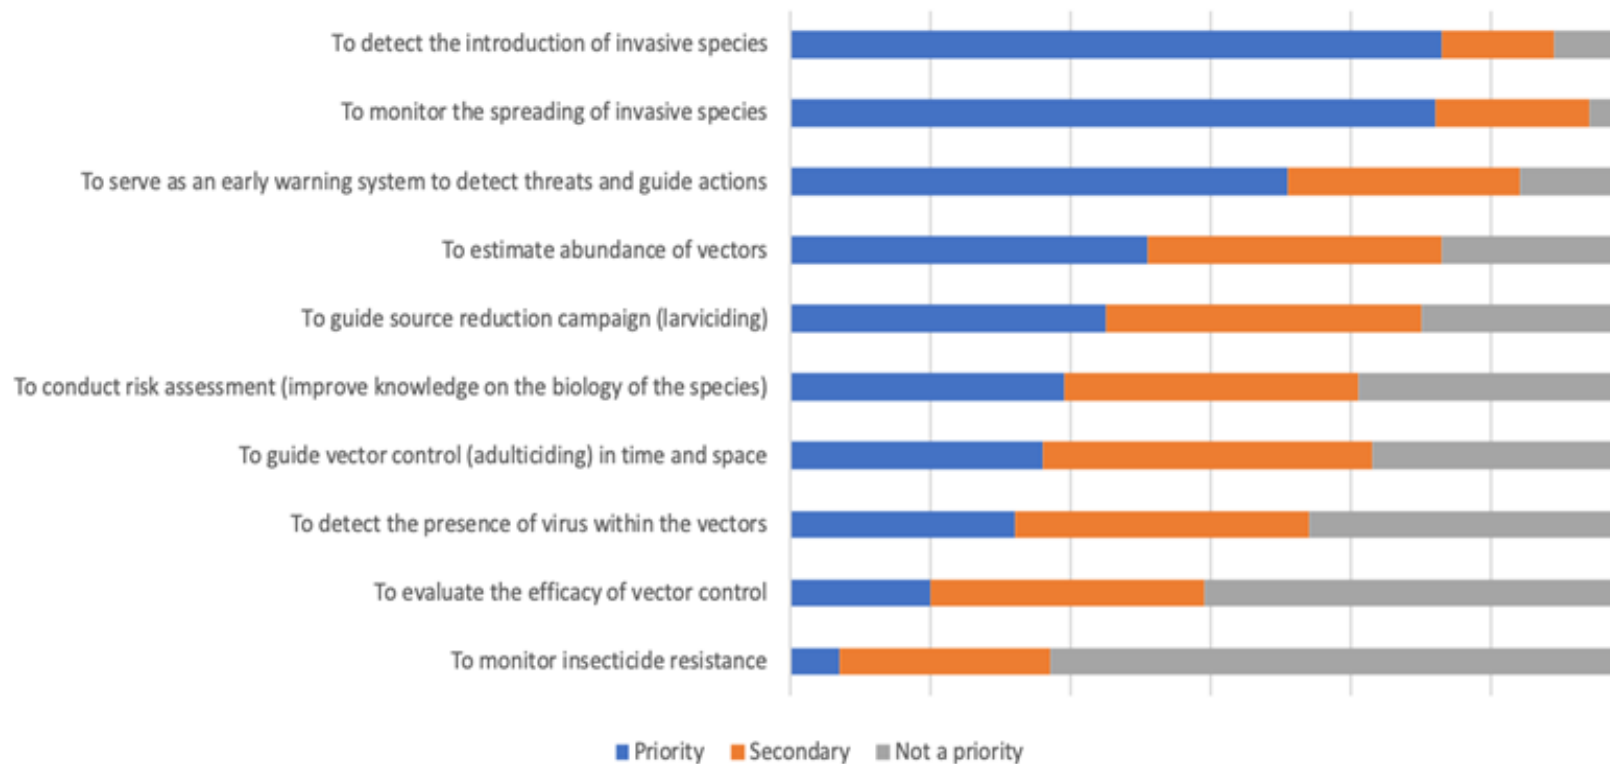

- To facilitate the ToK to researchers and stakeholders and to promote data sharing and harmonization to assure comparable outputs in terms of AIMs surveillance.
- One of the activities was to develop a Questionnaire (AIM Cost Athens and EMCA La Rochelle meetings).
- The Questionnaire aimed to obtain information about the monitoring and surveillance activities conducted at European level.
- Including a list of Guidelines used for M&S

Q6. What are the objectives of AIM surveillance in your country?
-Countries without AIMs-

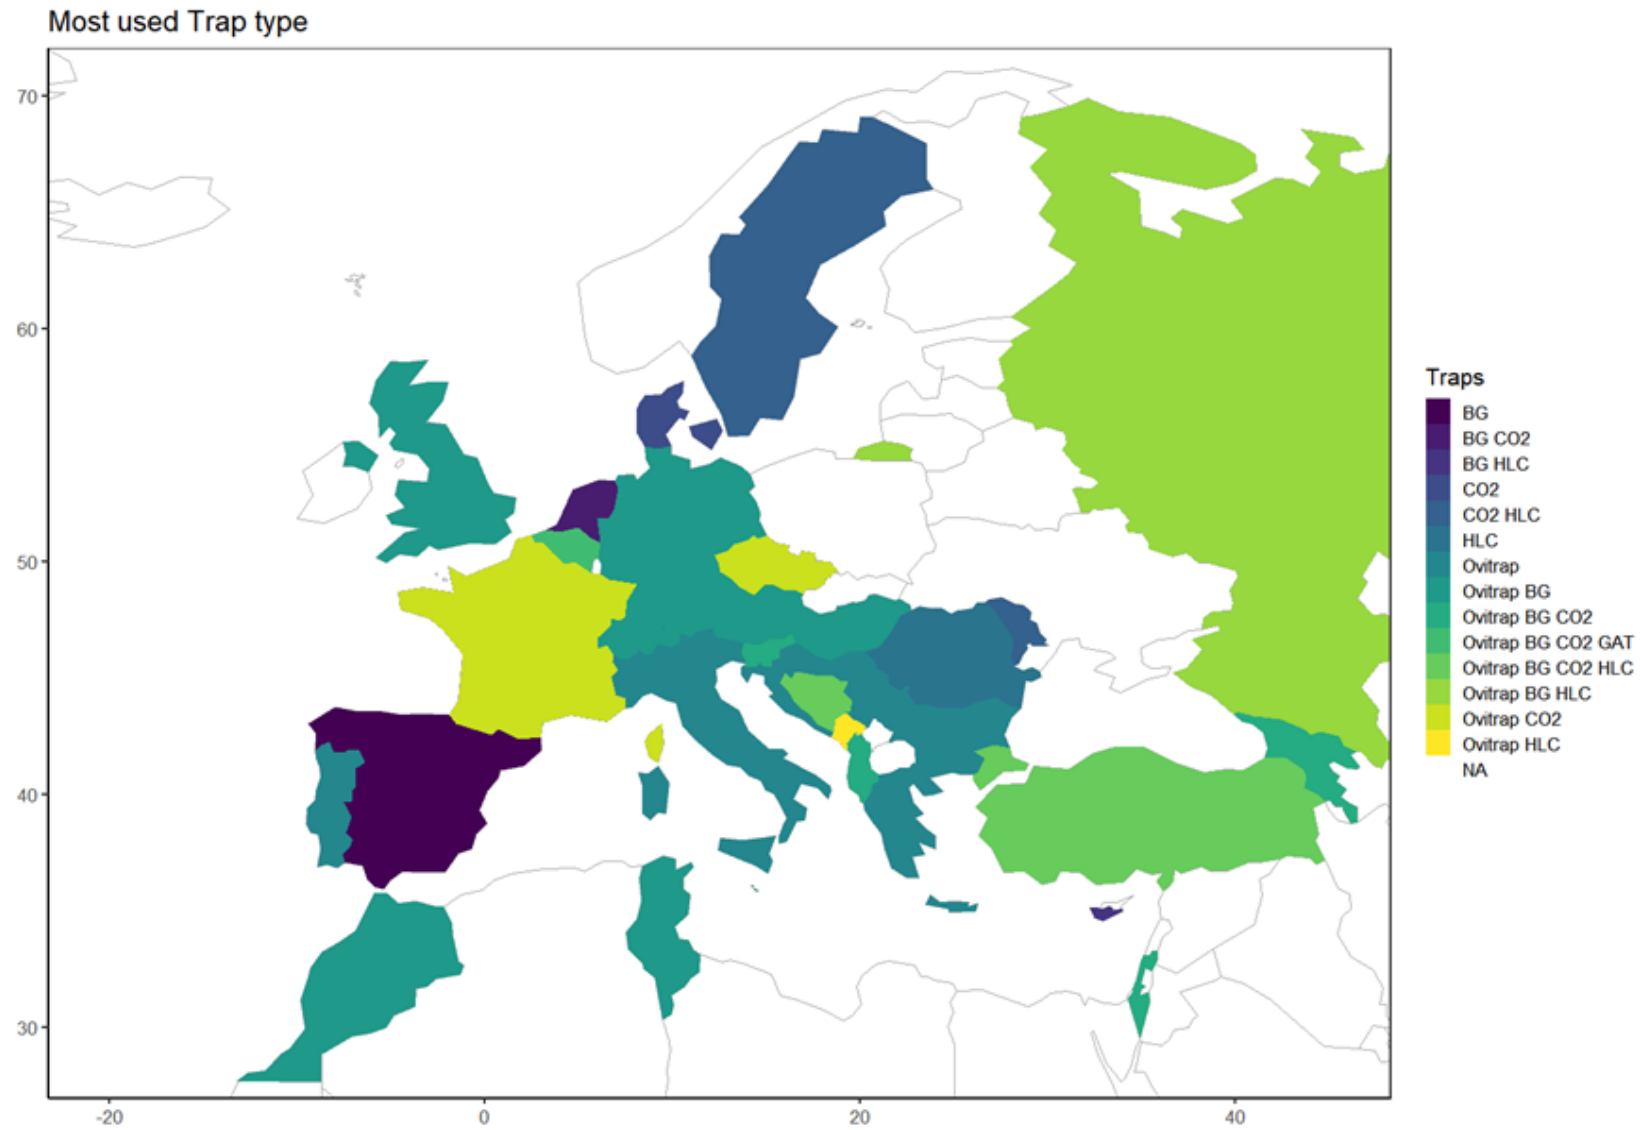

Q6. What are the objectives of AIM surveillance in your country?

-Countries with AIMS established and sporadic records-

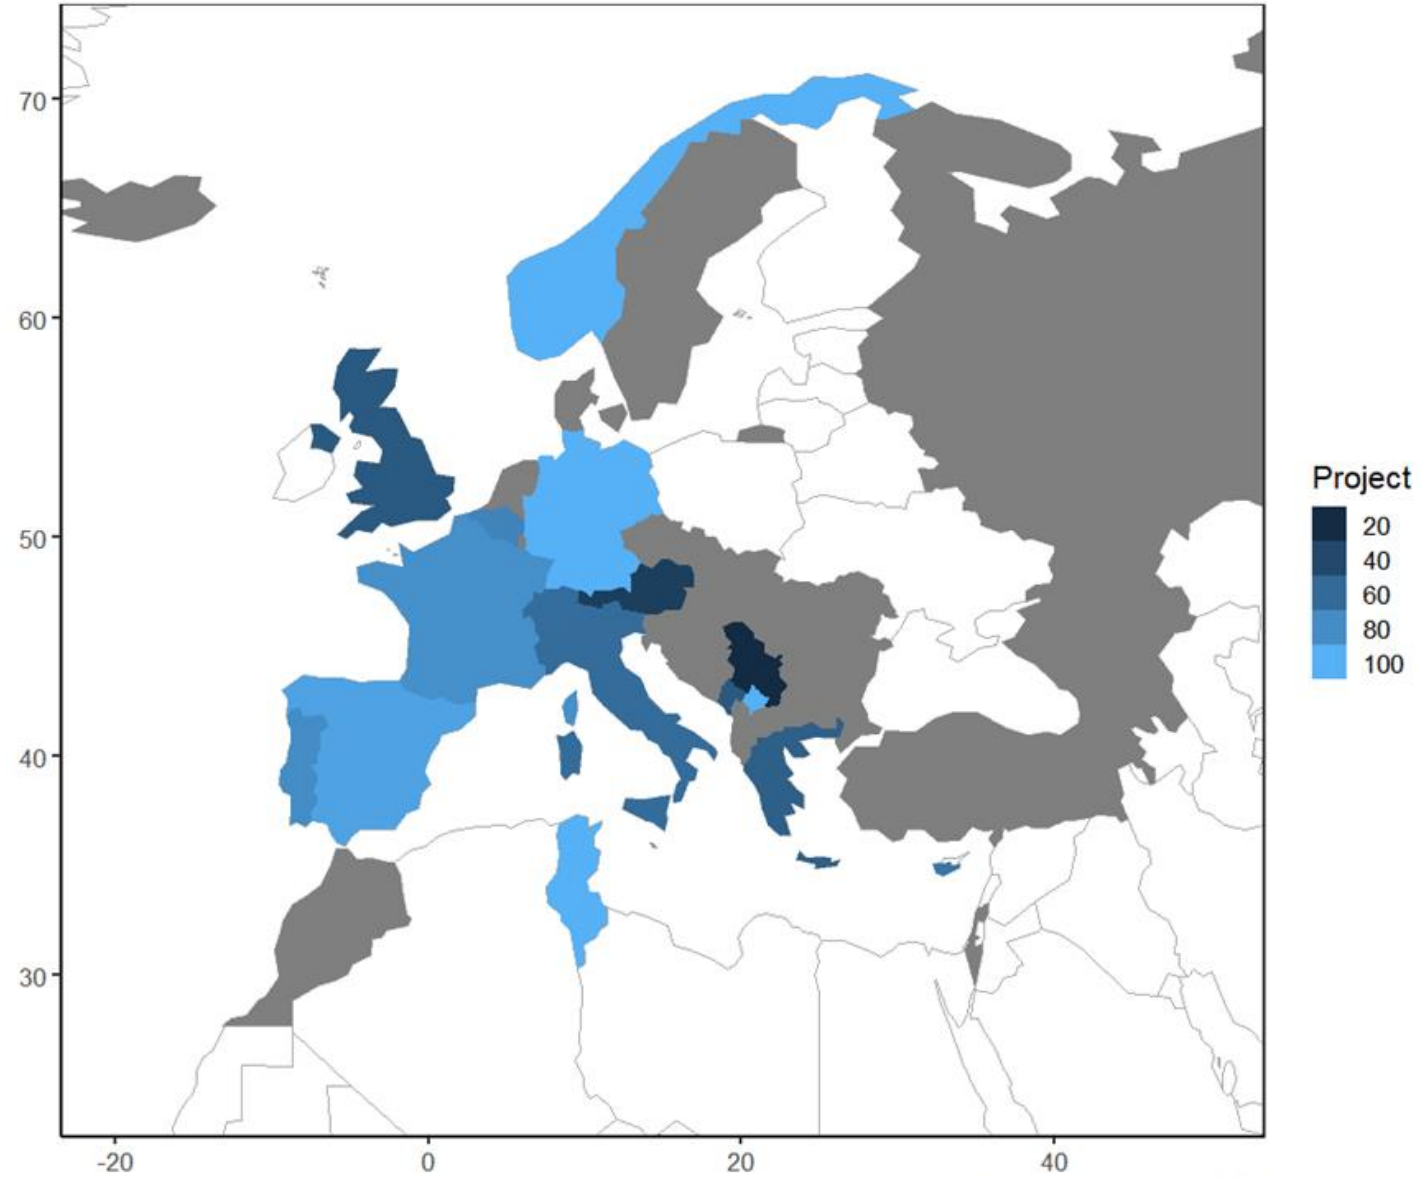

Trap types used

19a. Are you aware of or using any of the existing guidelines for mosquito SURVEILLANCE/CONTROL?:
Monitoring or Surveillance

Guidelines you know (Q19a)

Activities for 2020

- AIM COST has developed a protocol to be used in 2020 in order to harmonize surveillance among the participants.
- Contribution to the 2020 AIM Surveillance is open to any participant.
- Will be discussed during the week.
- Presented and finalized on Friday.

Harmonised surveillance of Aedes Invasive Mosquitoes (AIMs) throughout 2020 season.

Main objective:

To conduct surveillance activities of AIM species in different countries in order to provide data sets that can be comparable thanks to the use of harmonised methods, equipment, time and frequency of sampling, as well as in reporting of results.

To contribute to a harmonised continental overview of the AIMs species in Europe and the Mediterranean Basin by combining results from different geographical locations for drawing distribution, abundance and seasonality maps including by modelling.
